

WDD 430: Web Full-Stack Development

Week 02 Team Project and Code Review

1. Team Meeting Summary

Team Members:

- Saul Arana
- Nicholas Goodsell

Team Leader:

Nicholas Goodsell

Meeting Format:

Team chat discussion

Selected Project:

Community Volunteer Hub

Meeting Summary:

Because it was difficult for the team members to coordinate a video meeting, the team discussed the project through chat. During the discussion, we agreed to continue with the Community Volunteer Hub project because Nicholas had already made progress on the project and had an initial project structure available. We agreed to work together on the existing project rather than starting a completely new project. We also agreed to use the existing GitHub repository, project specification, GitHub issues, and project workflow as the foundation for the team's development.

Why We Selected This Project:

We selected Community Volunteer Hub because it addresses a practical community need by helping people find volunteer opportunities and allowing organizations to post volunteer projects. The project also provides enough functionality and scope for both team members to contribute while allowing us to build the application incrementally.

2. GitHub Repository

Repository:

<https://github.com/Nick2590/community-volunteer-hub>

The repository is public and contains the initial Next.js project structure, configuration files, README, and project documentation. The repository provides the foundation for the team to begin implementing the Community Volunteer Hub application.

The README describes the project as a web application that helps people find volunteer opportunities in their local community and allows organizations to post volunteer projects.

3. GitHub Project Board

Project Board:

<https://github.com/users/Nick2590/projects/1>

The project board is intended to organize the team's work using GitHub issues and to track the progress of the application's features.

The project currently contains issues covering major user stories and features, including:

- User registration and sign-in
- Volunteer and Organization roles
- Volunteer opportunity listings
- Volunteer opportunity search
- Volunteer project details
- Volunteer project signup
- Volunteer dashboard
- Organization project creation
- Organization project editing and deletion

These issues provide an incremental development plan for the project.

4. Specification Document

Specification / Pull Request:

<https://github.com/Nick2590/community-volunteer-hub/pull/1>

The specification was created using Spec-Kit and documents the main requirements and planned functionality for Community Volunteer Hub.

The specification covers user registration and authentication, Volunteer and Organization roles, browsing and searching volunteer opportunities, project details, volunteer signup, volunteer dashboards, and organization project management.

The project also includes development workflow documentation and configuration for maintaining consistent development practices.

5. Specification Build Reflection

Creating the specification with the Spec-Kit AI tool helped the team organize the project's requirements before beginning implementation. The main challenge was reviewing and refining the generated material so that the requirements matched the actual goals and scope of the Community Volunteer Hub. The final specification provides a clearer foundation for creating GitHub issues and implementing the project incrementally.

6. Code Review: Issue

Assigned Teammate:

Nicholas Goodsell

Repository Reviewed:

<https://github.com/Nick2590/community-volunteer-hub>

Issue Title:

Replace default Next.js starter page with Community Volunteer Hub interface

Label:

should-fix

Issue URL:

<https://github.com/Nick2590/community-volunteer-hub/issues/11#issue-5453535434>

Problem

The initial application page needed to represent the Community Volunteer Hub project instead of relying on the default Next.js starter interface.

Impact

Leaving the default starter content would make the deployed application look like an unmodified Next.js project and would make it difficult for users to understand the purpose of Community Volunteer Hub. A project-specific landing page provides a clearer starting point for future functionality and gives the rendered application a more professional presentation.

Suggested Fix

Replace the default Next.js starter content with an initial Community Volunteer Hub interface. The page should clearly communicate the purpose of the application and provide navigation or calls to action for the planned functionality, such as browsing volunteer opportunities and signing in. The implementation should continue following the project's TypeScript, ESLint, Prettier, and Next.js conventions.

7. Code Review: Rendered Site

Rendered Site:

<https://community-volunteer-hub-ebon.vercel.app/>

Rendered Site Review

- **Minimum Requirements:** The deployed site provides an initial Community Volunteer Hub interface and clearly communicates the purpose of the application. The site includes navigation and calls to action related to the planned volunteer functionality.

- **Responsive Behavior:** The site should be checked at mobile and desktop viewport sizes to verify that the navigation, hero section, buttons, and content remain readable and usable without horizontal scrolling.
- **Navigation and Links:** The application provides navigation for the main areas of the project, including the home page, volunteer opportunities, and sign-in functionality. The available links should be tested to ensure they lead to the intended pages or planned routes.
- **API Route:** The `/api/hello` endpoint should be verified as part of the assignment requirements.
Result: 404 This page could not be found.
- **Lighthouse Performance:**
Mobile Performance Score: 100%
- **Lighthouse Accessibility:**
Mobile Accessibility Score: 100%
- **Lighthouse Best Practices:**
Mobile Best Practices Score: 100%
- **Lighthouse SEO:**
Mobile SEO Score: 100%
- **CSS Overview:** The CSS Overview should be reviewed for contrast problems and unused CSS.
Result: The review did not identify significant color contrast problems. The current CSS is relatively simple because the project is still in its initial development stage. As more components and features are added, the team should continue monitoring unused CSS and accessibility-related contrast issues.
- **Strength:** One strength of the current implementation is that the landing page clearly communicates the purpose of Community Volunteer Hub. A visitor can understand that the application is intended to connect people with volunteer opportunities and organizations.
- **Actionable Improvement:** Continue improving the responsive layout and accessibility of the navigation and interactive elements while implementing the project's planned functionality. In particular, the next development steps should connect the current interface to the volunteer opportunity listing and authentication features defined in the project specification.

8. Overall Completion

The team has established the initial foundation for the Community Volunteer Hub project. The repository, project specification, GitHub issues, development workflow, and deployed Next.js application provide a starting point for incremental development.

The application does not need to have all planned features implemented during Week 02. The current goal is to establish the project structure, define the requirements, organize the development work, and begin reviewing the rendered application before moving into further implementation.

The next development steps will focus on implementing the user stories defined in the specification, including authentication, user roles, volunteer opportunity browsing and searching, project details, volunteer signup, dashboards, and organization project management.
